                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ΩD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ŏ
                                                                                                                                              This is a peptide derived from mouse epidermal growth factor (EGF) residues 33-42. This peptide is used in the invention to prepare a composition to target laminin receptors. EGF derived peptides inhibit blood vessel formation through their antagonism of the high affinity 67kD laminin receptor found on endothelial cells. The peptide is modified from the natural sequence to prevent protease attack. The peptide is used in the preparation of a medicament for binding to laminin receptors as an wounds and treating anglogenic diseases, especially retinopathy of immaturity. Other diseases treated include metastatic cancer, candida spp. infection, and parasitic infestations like leishmania and trichomonas vaginalis. The peptide are anti-anglogenic in human models. The peptides also inhibit both laminin and EGF-stimulated anglogenesis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel ErbB-4 ligand, neuregulin-4 (NRG-4). NRG-4 binds to mammalian ErbB-4 receptor and can be expressed by standard recombinant methodology. Pharmaceutical compositions comprising NRG-4 are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel ErbB-4 ligand, referred as neuregulin (NRG)-4 and polynucleotide sequences encoding NRG-4, useful for upregulating or downregulating ErbB-4 receptor activity to treat Alzheimer's disease, stroke, gastric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ErbB-4; neuregulin-4; NRG-4; pro-NRG-4; neuroprotective; vulnerary;

This method produces the peptide smoothly, with high purity and yield.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                      The inventors claim synthetic peptides which correspond to sequences occurring in EGF, but excluding EGF. The synthetic peptides correspond to active sequences from EGF fragments: 3·14, 12·14, 12·15, 3·10, 29·37 and 33·37 (Claims 2·7 and AAP91659-p91664 resp.). The peptides are anglogenic. Their relative shortness means that they pose fewer synthesis problems than the entire EGF molecule.

EGF is modified to increase its chemical stability. Its storage life is improved without diminishing its biological activity. The proteins may be prepared by traditional chemical or recombinant means.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for

```
chimeric EGF protein contains sequences derived from human and mouse EGF sequences. The chimeric EGF proteins can be recombinantly produced by culturing a microorganism of the genus Bacillus transformed by an expression vector containing the encoding DNA molecules. The recombinant chimeric EGF proteins exhibit a wide variety of physiological activities similar to those of naturally occurring EGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Epidermal growth factor; EGF; chimeric; human; mouse; recombinant.

                                                                                                                                                                                                                                                  The sequences given in AAR67273-76 are cell growth factors which may be used in the viscoelastic solution of the invention. The peptides growth factor (FGF) and epidermal growth factor (FGF) and epidermal growth factor (FGF). The viscoelastic solution also comprises a buffered solution which is pref. a buffered balanced salt solution, at least 1 of hydroxy or carboxypropyl methylcellulose, actilulose gum, dextran or dextran sulphate, chondroitin sulphate, and sodium hyaluronate. It has a pH of 6-8 and an osmolarity of 200-400 moSmol/1. The growth factors are mitogenic in vitro for a wide range of tissues and the viscoelastic soln. May be used as a surgical soln. which is in direct contact with cells undergoing wound healing. It also provides a cell protection and cell coating during surgery. The soln. provides maintenance of tissue space, hydroxypropyl methylcellulose and chondroitin sulphate lubricate the tissue, while sodium hyaluronate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents mouse epidermal growth factor (BGF)

from the present invention. The present invention describes a method for
the isolation of recombinant epidermal growth factor (EGF) from whole
broth. The method comprises: (a) passing a culture containing the
choth. The method comprises: (a) passing a culture containing the
protein upwards through a column containing a fluidised bed of ion
cachanger, washing the ion exchanger to remove non-adsorbed material,
allowing the ion exchanger to settle, and eluting adsorbed protein by
passing an eluant downwards through the column; (b) filtering the eluate
through a membrane with a molecular weight cutoff of 10000, and (c)
concentrating the filtrate on a membrane with a molecular weight cutoff
of 5000. The method is for isolating recombinant human, mouse, pig or
cat EGF, or an EGF analogue with one of four defined amino acid sequences
(given in the specification), from Bacillus brevis cultures. The EGF
proteins can be recovered in high yield and high purity without the need
to pretreat the culture broth to remove the cells, e.g. by costly
                                                                                                                                                                                                                                  ö
                                                                This is a chimeric epidermal growth factor (EGF) protein ABC. This chimeric EGF protein contains sequences derived from human and mouse EGF sequences. The chimeric EGF proteins can be recombinantly produced by culturing a microorganism of the genus Bacillus transformed by an expression vector containing the encoding DNA molecules. The recombinant chimeric EGF proteins exhibit a wide variety of physiological activities similar to those of naturally occurring EGF.
                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolation of recombinant epidermal growth factor from whole broth

factor (EGF) like activity, from the present invention. The present actor (EGF) like activity, from the present invention describes a method for the isolation of recombinant epidermal growth factor (EGF) from whole broth. The method comprises: (a) passing a culture containing the protein upwards through a column containing a fluidised bed of ion exchanger, washing the ion exchanger to remove non-adsorbed protein by passing an eluant downwards through the column; (b) calsorbed protein by passing an eluant downwards through the column; (b) filtering the eluate through a membrane with a molecular weight cutoff of 10000, and (c) concentrating the filtrate on a membrane with a molecular weight cutoff of 5000. The method is for isolating recombinant human, mouse, pig or rat EGF, or an EGF analogue with one of four chuman, mouse, pig or rat EGF, or an EGF analogue with one of four chuman, mouse, pig or tat EGF, or an EGF analogue with one of four chuman, mouse, pig or tat EGF, or an EGF analogue with one of four chuman, mouse, pig or tat EGF, or an EGF analogue with one of four chuman, mouse, pig or tat EGF, or an EGF analogue with one of four chuman, mouse, pig or tat EGF, or an EGF analogue with one of four chuman, mouse, pig or tat EGF, or an EGF analogue with one protein or analogue with one of four contents cultures. The EGF proteins can be recovered in high yield and high purity without the need to pretreat the culture broth to remove the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a protein which has epidermal growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           recombinant epidermal growth factor from whole broth -

fragment of a Plasmodium mercocite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of plasmodium MSP-1_4_2. compared to natural MSP-1_1_9. The non-natural variants of the present invention are useful for immunising a mammal against malaria, and can be used to treat malaria. The present sequence is human epidezmal growth factor (EGF). This sequence was used in a sequence homology comparison with the wild-type MSP-1 protein from P. falciparum (see AAB37608), which was used to generate the variants of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Humanised form; monoclonal antibody alpha 340; gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a protein which has epidermal growth factor (BGF) like activity, from the present invention. The present invention describes a method for the isolation of recombinant epidermal growth factor (BGF) from whole broth. The method comprises: (a) passing a culture containing the protein upwards through a column containing a fluidised bed of ion exchanger, washing the ion exchanger to remove non-adsorbed protein by passing an eluant downwards through the column; (b) filtering the eluate through a membrane with a molecular weight cutoff of 10000, and (c) concentrating the filtrate on a membrane with a molecular weight cutoff of 5000. The method is for isolating recombinant human, mouse, pig or rat EGF, or an EGF analogue with one of four defined amino acid sequences (given in the specification), from Bacillus breath with whithout the need to pretreat the culture broth to remove the cells, e.g. by costly centrifugation or membrane filtration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

polynucleotides (1). The method comprises contacting a population of single-stranded scaffold fragments (SF) with population of donor fragments (BF) to form a complex (II) comprising at least one SF whybridised to two DFs. (II) is treated so that single stranded regions of (II) are filled-in and adjacent fragments are ligated. (MI) is useful for a directed evolution process which involves forming a library of (I) that can be screened for a characteristic of interest. Subsequent rounds of directed evolution can produce chimeric polynucleotides with an improved characteristic of interest. The methods facilitate the concerning of chimeric polynucleotides with an improved characteristic polynucleotides and do not require hybridising concerning process does not rely upon a contiguous, full-length cemplate, it is unnecessary to modify a template to facilitate its removal. This is the amino acid sequence of the mouse epidermal growth factor (EGF) used to demonstrate a method of in vitro recombination
                                                                                                                                                                                                                                                                                                                                               Forming chimeric polynucleotide by contacting single-stranded (ss) scaffold fragment, and donor fragment populations to form hybridised complex having ss regions which are filled-in, and ligating adjacent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mouse; epidermal growth factor; receptor; EGF; chimeric polynucleotide; directed evolution; chimeragenesis; recombination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a method of forming (MI) chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modified mouse epidermal growth factor (EGF).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "Encoded by ACC"

                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a humanised form of the antibody 340 (a mouse monoclonal antibody which binds to epidermal growth factor (EGF) receptor and inhibits binding of EGF), obtainable from the cell line deposited with the ECACC under accession number 97021428. The humanised form of the antibody 340 is useful in gene therapy, medicine and in the manufacture of a medicament for treatment or prophylaxis of cancer. The invention is useful for treating colorectal, lung, breast, gastric or ovarian cancers or also for preventing the recurrence of cancer after initial treatment or surgery. The invention is also useful for enhancing a protective immune response against cancer by optimised immunisation schedules. The humanised form of the antibody 340 has reduced immunospenicity but shows similar binding to cells expressing EGF receptor, as the original murine antibody and has increased ability to inhibit the growth of EGF receptor expressing cells. The invention is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                         New humanized form of mouse monoclonal antibody 340 which binds to epidermal growth factor receptor and inhibits binding of growth factor, useful for treating colorectal, lung, breast, gastric and ovarian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  :

The invention uscentibut of toliming (m.) channeric polynucleotides (I). The method comprises contacting a population of single-stranded scaffold fragments (SF) with population of donor fragments (BF) to form a complex (II) comprising at least one SF hybridised to two DFs. (II) is treated so that single stranded regions of (II) are filled-in and adjacent fragments are ligated. (M.) is useful for a directed evolution process which involves forming a library of (I) that can be screened for a characteristic of interest. Subsequent rounds of directed evolution can produce chimeric polynucleotides with an improved characteristic of interest. The methods facilitate the generation of chimeric polynucleotides and do not require hybridising donor fragments to a target- or full-length template. Because the chimeric chimeric polynucleotides and contiguous, full-length chimeragenesis process does not rely upon a contiguous, full-length chimeragenesis process does not rely upon a contiguous, full-length chimeragenesis the amino acid sequence of a mouse epidermal growth factor (EGF) modified to make it as similar as possible to the human protein (AAU76705) and used to demonstrate a method of in vitro
                                                                                                                                                                                                                                                                                                                                                Forming chimeric polynucleotide by contacting single-stranded (ss) scaffold fragment, and donor fragment populations to form hybridised complex having ss regions which are filled-in, and ligating adjacent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a method of forming (M1) chimeric
                                                                                                                                                                                                (ENCH-) ENCHIRA BIOTECHNOLOGY CORP.

epidermal growth factor precursor - rat
NAlternate names: urogastrone precursor
C.Species: Rattus norvegicus (Norway rat)
C.Date: 31-Dec-1988 #sequence_revision 14-Aug-1998 #text_change 18-Jun-1999
C.Species: 805074; 801974; A25425; S18419; S08288
R.Sagti, S.J.; Safirstein, R.; Price, P.M.
DNA Cell Biol. 11, 481-487, 1992
A.Title: Cloning and Sequencing of the Rat Preproepidermal Growth Factor CDNA: Comgar
A.Reference number: 152995; MUID:92398779; PMID:1524680
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    C; Comment: EGF is released in the pancreas, small intestine, mammary gland, and (in s C; Comment: The EGF precursor is found in kidney as a receptor-like membrane-bound pro C; Superfamily: epidermal growth factor precursor; EGF homology; LDL receptor WWTD-con C; Keywords: duplication; growth factor; mitogen; tandem repeat; transmembrane prote. Tidentification of the proteoglycan versioan in aorta and smooth muscle cells by DNA sequence analysis, in situ hybridization and immunohistochemistry. ;

Matrix Biol. 14:213-225(1994).

I FUNCTION: May play a role in intercellular signaling and in connecting cells with the extracellular matrix. May take part in the regulation of cell motility, growth and differentiation. Binds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DEVELOPMENTAL STAGE: Disappears after the cartilage development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PGCV_MACNE STANDARD; PRT; 862 AA.

Dev. 112:157-160(2002).

-!- FUNCTION: Receptor that may have an important role in cell/cell standing during nervous system formation.

-!- SUBCELLUIAR LOCATION: Integral membrane protein.
-!- DEVELOPMENTAL STAGE: Predominantly expressed in the developing CNS, the emerging dorsal root ganglia and cranial ganglia. In the CNS, expression is uniform along the rostrocaudal axis. During gastrulation, it is expressed within the anterior neural ectoderm. At El0, expression is strong in the ventricular zones (VZ) in all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Usui T., Shima Y., Shimada Y., Hirano S., Burgess R.W., Schwarz T.L., Takeichi M., Uemura T.; Hirano S., Burgess R.W., Schwarz T.L., Flamingo, a seven-pass transmembrane cadherin, regulates planar cell polarity under the control of frizzled."; cell 98:585-595(1999).

                      Sectors of the brain, and lower in the marginal zones (MZ).
Between E12 and E15, expression is prominant in the brain. It is strong in VZ, lower in MZ, except in telecephalic MZ where it is predominant. The intensity is higher in all VZ, and lower in differenciating fields than in VZ, except in the cerebral hemispheres, and to a lesser extent in the tectum and cerebral hemispheres, and to a lesser extent in the fetal lungs, kidney and epithelia. In the newborn and postrating and postmigratory is troughout the brain.

C = 1 TISSUE SPECIFICITY: Expressed in the CNS and in the eye.

I TISSUE SPECIFICITY: Expressed in the CNS and in the eye.

DOMAIN: ERBB RECEPTOR BINDING IS ELICITED ENTIRELY BY THE EGF-LIKE DOMAIN (BY SIMILARITY).

PTH: PROTEDLYTIC CLEAVAGE CLOSE TO THE PLASMA MEMBRANE ON THE EXTERNAL FACE LEADS TO THE RELEASE OF THE SOLUBLE GROWTH FACTOR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "Characterization of a neuregulin-related gene, Don-1, that is highly expressed in restricted regions of the cerebellum and hippocampus."; Mol. Cell. Biol. 17:4007-4014(1997).

**Nol. Cell. Biol. 17:4007-4014(1997).

**PURCTION: DIRECT LIGAND FOR ERBB3 AND ERBB4 TYROSINE KINASE RECEPTORS. CONCOMITANTLY RECRUITS ERBB1 AND ERBB2 CORECEPTORS, RESULTING IN LIGAND-STIMULATED TYROSINE PHOSPHORYLATION AND ACTIVATION OF THE ERBB RECEPTORS. MAY ALSO PROMOTE THE HETERODIMERIZATION WITH THE EGF RECEPTOR.

**INTERNATION: EXISTS AS AN TYPE I MEMBRANE PROTEIN AND AS A PROTECLYICALLY RELEASED SOLUBLE GROWTH FACTOR FORM. THE MEMBRANE-BOUND FORM DOES NOT SEEM TO BE ACTIVE (BY SIMILARITY).

**INTERNATIVE PRODUCTS: A LIGAST 4 ISOSORMS; DON-1M, DON-1S/ARG2-5, NRG2-10 AND NRG2-16 (SHOWN HERE); ARE PRODUCED BY ALTERNATIVE
                                                                                                                                                                                                                                                     16-OCT-2001 (Rel. 40, Created)
